## OpenCV & Python - Image too big to display

[Ask Question](#)

I have an image that is  $6400 \times 3200$ , while my screen is  $1280 \times 800$ . Therefore, the image needs to be resized for display only. I am using Python and OpenCV 2.4.9. According to [OpenCV Documentation](#),

If you need to show an image that is bigger than the screen resolution, you will need to call `namedWindow("", WINDOW_NORMAL)` before the `imshow`.

That is what I am doing, but the image is not fitted to the screen, only a portion is shown because it's too big. I've also tried with `cv2.resizeWindow`, but it doesn't make any difference.

```
import cv2
cv2.namedWindow("output", cv2.WINDOW_NORMAL)           # Create window with freedom of
dimensions                                              dimensions
# cv2.resizeWindow("output", 400, 300)                  # Resize window to specified
dimensions                                              dimensions
im = cv2.imread("earth.jpg")                           # Read image
cv2.imshow("output", im)                               # Show image
cv2.waitKey(0)                                          # Display the image infinitely until
any keypress
```

you should be able to resize image window by pointing cursor to the window borders – [orkan](#) Feb 3 '16 at 15:38

thanks for your reply, but when I do that, it resizes the window but not the image (the image is not fully displayed). And even if it worked, it's still not ideal since I have to drag the borders many times to finally fit it on the screen, and also this is aimed to be reading continuously from a webcam, I don't want the user to be resizing the window manually. – [Zynk](#) Feb 3 '16 at 16:00

Then just resize the image you're showing to your desired dimension – [Miki](#) Feb 3 '16 at 16:01

Thanks, @Miki, I decided to do that. I had not done that before because OpenCV documentation claims to fit it to the screen automatically as in the link I provided, but that was not happening and that was what I wanted to solve. But resizing is fine too, I guess. – [Zynk](#) Feb 3 '16 at 17:00

I think you should do something like [this](#) – [Ar Win](#) Dec 26 '17 at 12:21

### 3 Answers

Although I was expecting an automatic solution (fitting to the screen automatically), resizing solves the problem as well.

```
import cv2
cv2.namedWindow("output", cv2.WINDOW_NORMAL)           # Create window with
dimensions
im = cv2.imread("earth.jpg")                           # Read image
imS = cv2.resize(im, (960, 540))                       # Resize image
cv2.imshow("output", imS)                               # Show image
cv2.waitKey(0)                                          # Display the image
```

1 it's probably `cv2.imshow("output", imS)` – Miki Feb 3 '16 at 17:08

Yes, my mistake, I have it correctly on my code, but not here. Thanks

In opencv, `cv.namedWindow()` just creates a window object as you determine, but not resizing the original image. You can use `cv2.resize(img, resolution)` to solve the problem.

Here's what it displays, a 740 \* 411 resolution image.

By using our site, you acknowledge that you have read and understand our

, and our

```
cv2.waitKey(0)
cv2.destroyAllWindows()
```

Here, it displays a 100 \* 200 resolution image after resizing. Remember the resolution parameter use column first then is row.

```
image = cv2.imread("740*411.jpg")
image = cv2.resize(image, (200, 100))
cv2.imshow("image", image)
cv2.waitKey(0)
cv2.destroyAllWindows()
```

Got it. Thank you very much – [FrancisYL](#) May 11 at 23:52

Try this:

```
image = cv2.imread("img/Demo.jpg")  
image = cv2.resize(image,(240,240))
```

The `image` is now resized. Displaying it will render in 240x240.
